

Approximate HQ-vs-E3 sensitivity (not factorial)

Approximate only: HQ=(D1, omitted/default effort), E3=(D1,E3); historical default/build are unfrozen.

Cannot explain MQ-vs-D2-E8 because that contrast changes both distance and effort. HQ/E3 SSIM: 0.999260/0.998785; E3 > HQ for 11.8% of 790 features.
